**Student Name: RAVI**

**Branch: CSE**

**Semester: 5th**

**Subject Name: ADBMS**

**UID: 23BCS10340**

**Section/Group: KRG 3-A**

**Date of Performance: 30/10/2025**

**Subject Code: 23CSP-333**

**1. Aim: To understand and implement the setup of Amazon Relational Database Service (AWS RDS) by creating a database instance, configuring security groups, and establishing a secure connection between the local pgAdmin tool and the RDS instance hosted on the AWS Cloud.**

### 2. Objective:

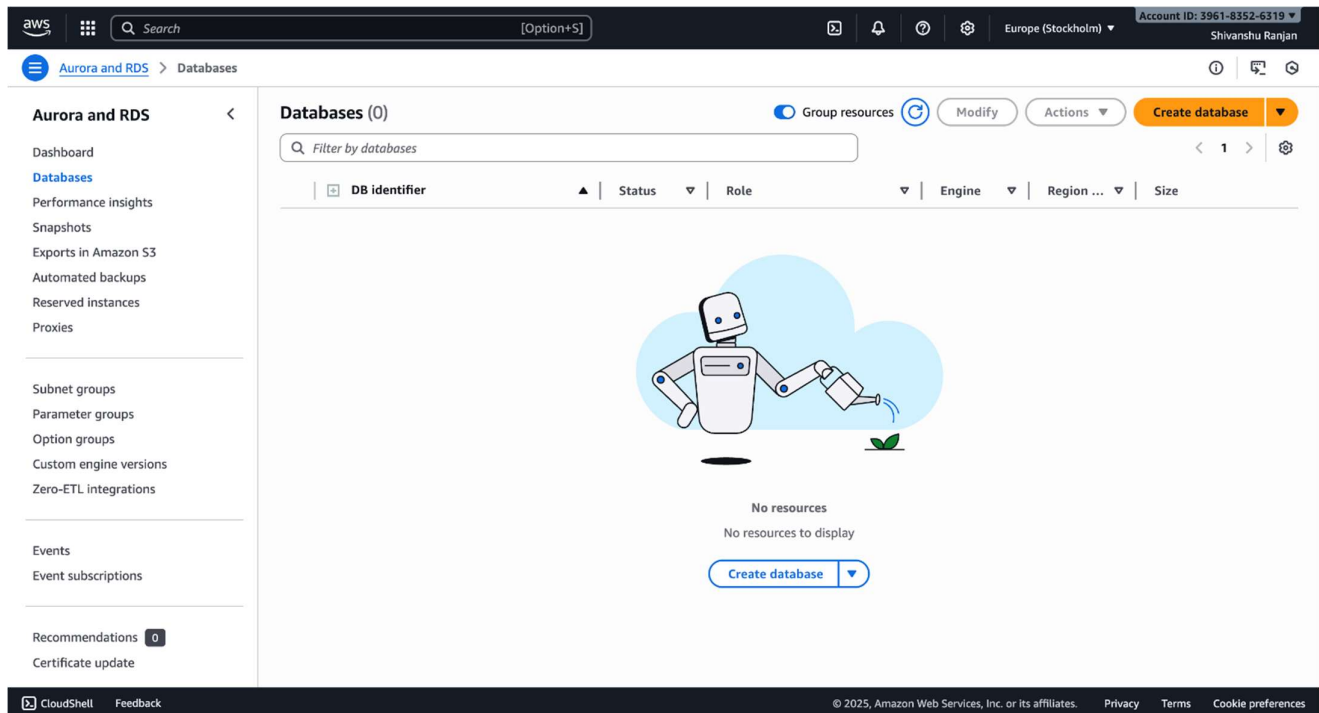

- To learn the basic concepts and features of Amazon Relational Database Service (AWS RDS).
- To create and configure a new RDS database instance on the AWS Management Console.
- To understand the role and configuration of security groups for controlling database access.
- To connect a local pgAdmin client to the AWS RDS instance securely using proper credentials and endpoint details.
- To verify successful database connectivity and perform basic operations through pgAdmin.

### 3. Code & Output:

**Choose a database creation method**

☐ Standard create  
You set all of the configuration options, including ones for availability, security, backups, and maintenance.

☒ Easy create  
Use recommended best-practice configurations. Some configuration options can be changed after the database is created.

**DB instance identifier**  
Type a name for your DB instance. The name must be unique across all DB instances owned by your AWS account in the current AWS Region.  
shivanshu-DB  
The DB instance identifier is case-insensitive, but is stored as all lowercase (as in "mydbinstance"). Constraints: 1 to 63 alphanumeric characters or hyphens. First character must be a letter. Can't contain two consecutive hyphens. Can't end with a hyphen.

**Master username** Info  
Type a login ID for the master user of your DB instance.  
postgres  
1 to 16 alphanumeric characters. The first character must be a letter.

**Credentials management**  
You can use AWS Secrets Manager or manage your master user credentials.  
☐ Managed in AWS Secrets Manager - *most secure*  
RDS generates a password for you and manages it throughout its lifecycle using AWS Secrets Manager.  
☐ Auto generate password  
Amazon RDS can generate a password for you, or you can specify your own password.

☒ Self managed  
Create your own password or have RDS create a password that you manage.

**Master password** Info  
Password strength Neutral  
Minimum constraints: At least 8 printable ASCII characters. Can't contain any of the following symbols: / ' \* @

**Confirm master password** Info

## 6. Choosing Deployment Option and Template

The screenshot shows the AWS RDS 'Create database' configuration page. The 'Database settings' tab is selected, displaying a table of configuration options and their values.

Configuration option	Value	Required
VPC security group	default	Yes
Publicly accessible	No	Yes
Database port	5432	Yes
DB instance identifier	shivanshu-DB	Yes
DB engine version	17.4	Yes
DB parameter group	default.postgres17	Yes
Monitoring type	Database Insights - Standard	Yes
Performance insights	Enabled	Yes
Monitoring	Enabled	Yes
Maintenance	Auto minor version upgrade enabled	Yes
Delete protection	Not enabled	Yes

At the bottom, there is a blue box with a warning icon and text: "You are responsible for ensuring that you have all of the necessary rights for any third-party products or services that you use with AWS services." Below this box are two buttons: "Cancel" and "Create database".

## 7. Configuring Database Settings (Name, Username, Password)

The screenshot shows the AWS RDS 'Databases' page. A blue banner at the top indicates that a database named 'shivanshu-db' is being created. Below the banner, the 'Databases (1)' section shows a table with one database entry.

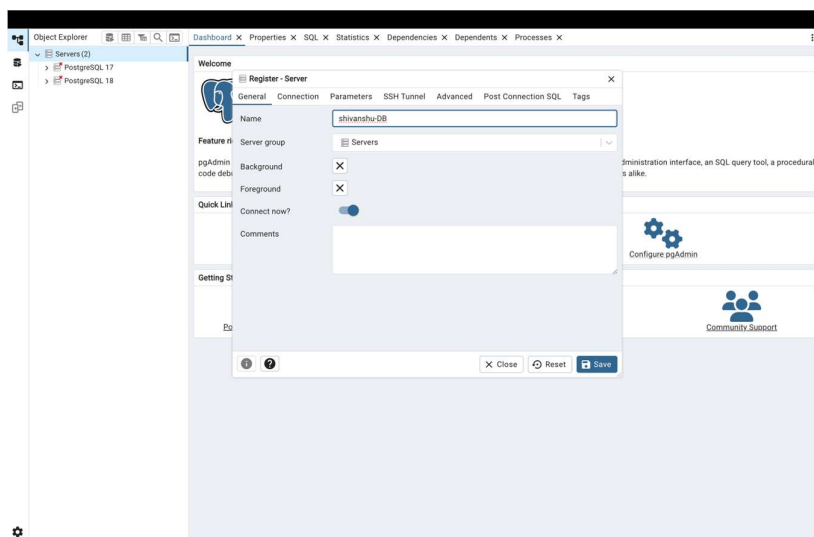

DB identifier	Status	Role	Engine	Region	Size
<a href="#">shivanshu-db</a>	Creating	Instance	PostgreSQL	-	db.t4g.micro

The left sidebar contains navigation links for 'Aurora and RDS', 'Dashboards', 'Databases', 'Performance insights', 'Snapshots', 'Exports in Amazon S3', 'Automated backups', 'Reserved instances', 'Proxies', 'Subnet groups', 'Parameter groups', 'Option groups', 'Custom engine versions', 'Zero-ETL integrations', 'Events', 'Event subscriptions', 'Recommendations', and 'Certificate update'.

## 8. Setting Up Instance Size and Storage

## 9. Configuring Connectivity and VPC Settings

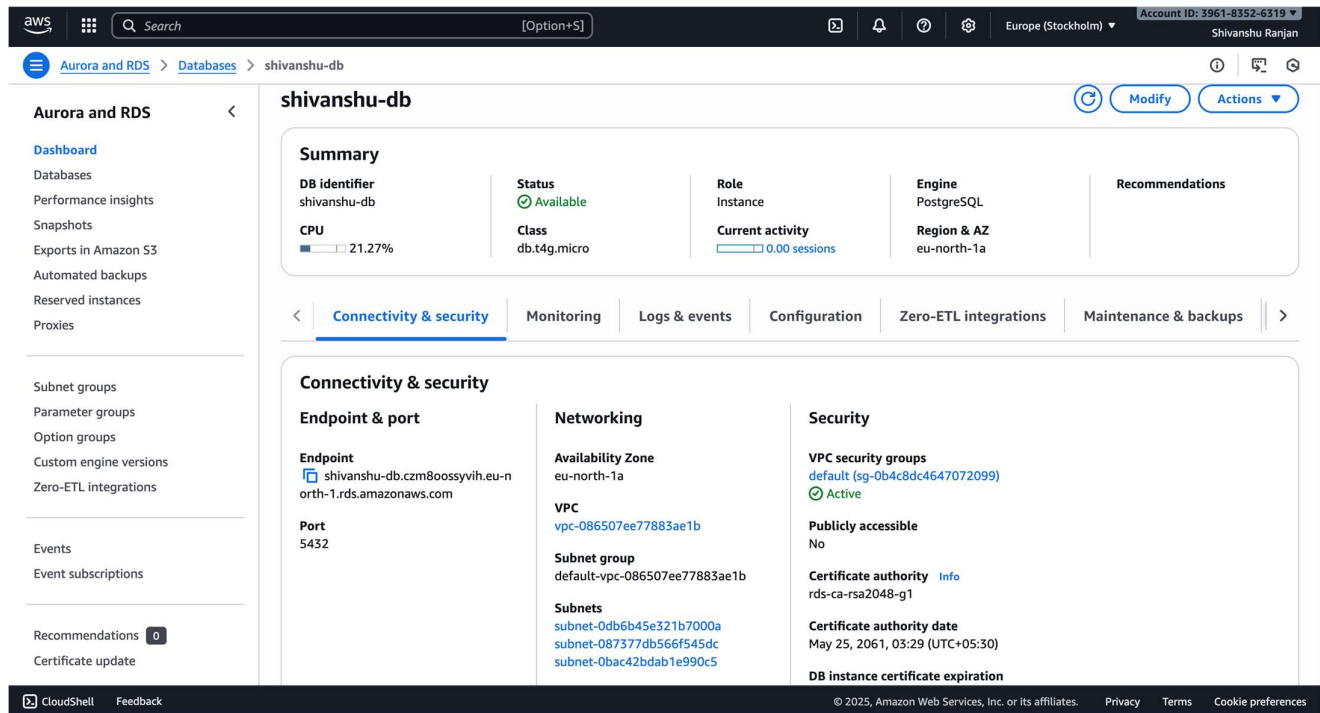

## 10. Gr Setting Up Security Groups for RDS Access

## 11. Additional Database Configuration Options

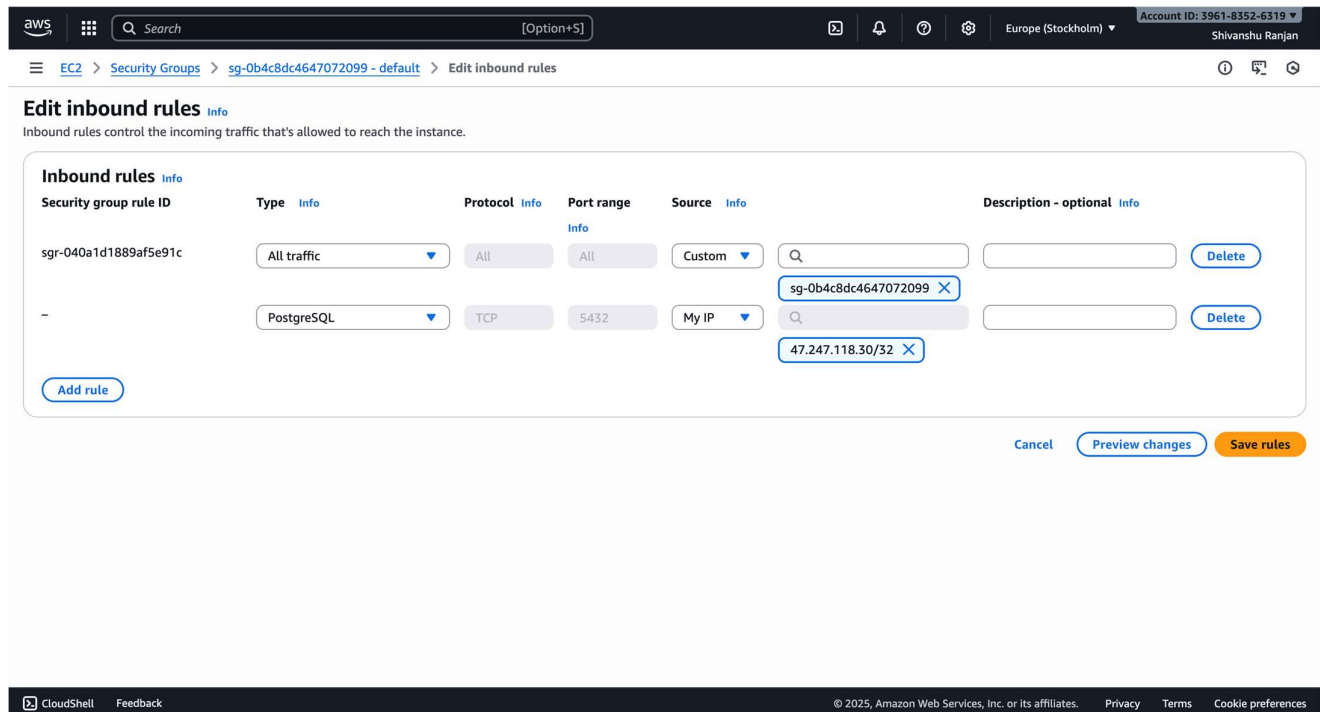

## 12. Reviewing and Creating the Database Instance

The screenshot shows the AWS Management Console interface for an Amazon RDS instance named 'shivanshu-db'. The left sidebar contains navigation links for Aurora and RDS, Databases, and various database management tasks. The main content area displays the instance details under the 'Summary' tab, including its status (Available), role (Instance), engine (PostgreSQL), and region (eu-north-1a). The 'Connectivity & security' tab is selected, showing the endpoint, port, availability zone, VPC, and security groups. The 'Security' section indicates that the instance is not publicly accessible and lists the VPC security groups and certificate authority.

## 13. RDS Instance Creation in Progress

The screenshot shows the AWS Management Console interface for editing inbound rules for a security group. The left sidebar contains navigation links for EC2, Security Groups, and the specific security group. The main content area displays the 'Edit inbound rules' page, which includes a table of existing rules and an 'Add rule' button. The table has columns for Security group rule ID, Type, Protocol, Port range, Source, and Description. The 'Add rule' button is highlighted, and the 'Preview changes' button is visible at the bottom right.

## 14. Viewing Database Instance Details

### ▼ Additional configuration

#### Public access

##### ☒ Publicly accessible

RDS assigns a public IP address to the database. Amazon EC2 instances and other resources outside of the VPC can connect to your database. Resources inside the VPC can also connect to the database. Choose one or more VPC security groups that specify which resources can connect to the database.

##### ☐ Not publicly accessible

No IP address is assigned to the DB instance. EC2 instances and devices outside the VPC can't connect.

#### Database port

Specify the TCP/IP port that the DB instance will use for application connections. The application connection string must specify the port number. The DB security group and your firewall must allow connections to the port. [Learn more](#)

## 16. Launching pgAdmin on Local Machine

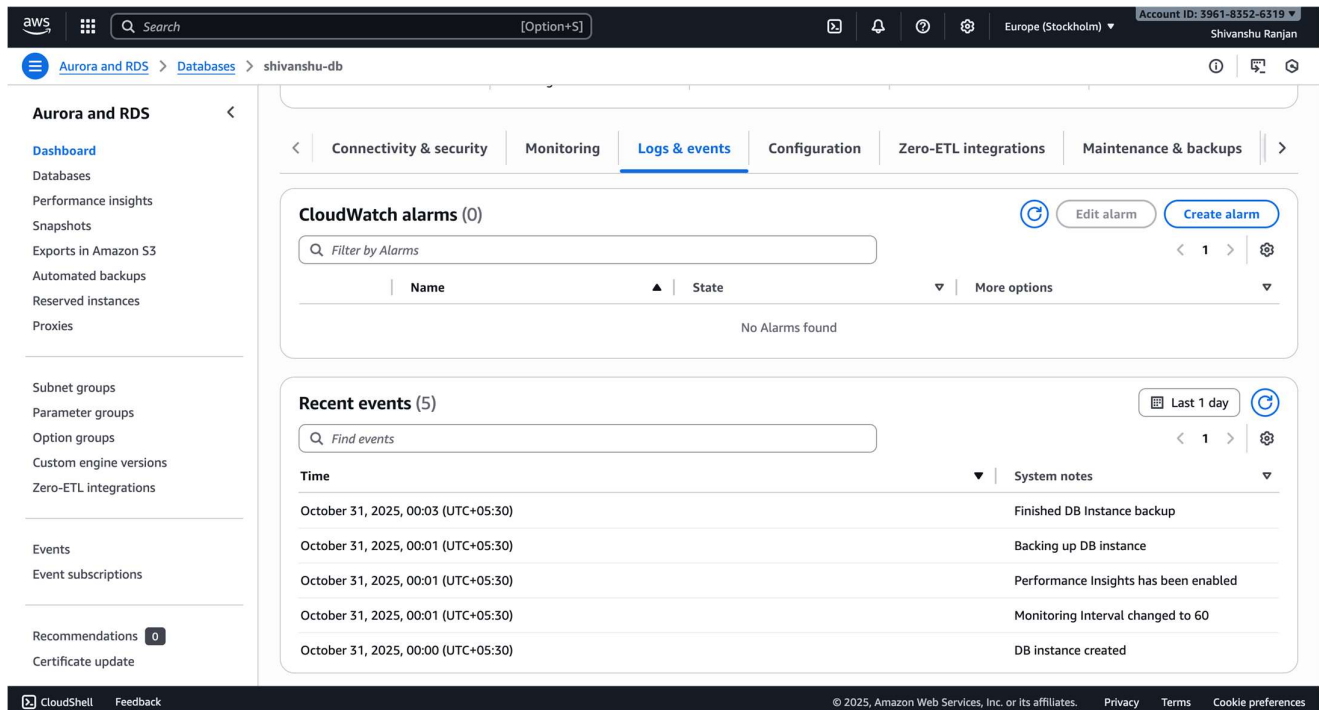

## 17. Adding a New Server in pgAdmin

## 18. Entering Connection Details (Endpoint, Username, Password)

## 19. Successful Connection to AWS RDS Database via pgAdmin

The screenshot displays the AWS Management Console interface. At the top, the navigation bar shows the AWS logo, a search bar, and the account ID: 3961-8352-6319. The main content area is titled 'Aurora and RDS' and 'Databases'. A blue banner at the top of the main area indicates 'Deleting DB instance shivanshu-db'. Below this, the 'Databases (1)' section shows a table with one entry:

DB identifier	Status	Role	Engine	Region ...	Size
shivanshu-db	Deleting	Instance	PostgreSQL	eu-north-1a	db.t4g.micro

The left sidebar contains various navigation links under 'Aurora and RDS', including Dashboard, Databases, Performance insights, Snapshots, Exports in Amazon S3, Automated backups, Reserved instances, Proxies, Subnet groups, Parameter groups, Option groups, Custom engine versions, Zero-ETL integrations, Events, Event subscriptions, Recommendations (0), and Certificate update. The bottom of the console shows the CloudShell icon, a feedback link, and the copyright notice: © 2025, Amazon Web Services, Inc. or its affiliates. Privacy, Terms, and Cookie preferences links are also present.

## 4. Learning Outcomes:

- Understand the fundamental concepts and benefits of using Amazon RDS for relational database management in the cloud.
- Gain practical knowledge of creating and configuring an RDS database instance on AWS.
- Learn how to manage and secure database access using AWS security groups.
- Develop skills to connect a local pgAdmin client to a cloud-hosted RDS instance.
- Be able to monitor, manage, and test database connectivity and performance in a cloud environment.
